#### **DETAILED ACTION**

### Claim Rejections - 35 USC § 103

- 1. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:
  - (a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negatived by the manner in which the invention was made.
- 2. Claims 11-15, 25-27, 29, 33, are rejected under 35 U.S.C. 103(a) as being unpatentable over Collentro et al.(5,766,479, 5,670,053). Reference '479 discloses a process treating water having the components claimed in step a), the process includes removal of hardness ions, dissolved gas, e.g. CO2, and more than one reverse osmosis treatment stages or passes (abstract, column 5, lines 20-68, column 6, lines 55). The product obtained by the process of '479 in a first RO membrane treatment contains ionized material, e.g. silica between 0-20 ppm, and TOC is substantially removed by pretreatment, e.g. activated carbon and nanofiltration, which removes organic matter (column 5, last paragraph, and column 6, first paragraph), further removal is expected by the reverse osmosis stages treatment, the low degree of TOC can be evidence by the level of resistivity in the ultrapure water, e.g. 10 megohm-cm can be produced, therefore, the water produced in the second stage meets the requirement of TOC levels claimed. Reference '479 fails to disclose the process steps in the order and conditions claimed in the present invention, but the products meets the conditions of the product water or treated water as claimed

Page 3

Application/Control Number: 09/243,237

Art Unit: 1723

including the TOC and silica levels. Reference '053 also discloses water product with the claimed TOC level, e.g., 1 to about 5 ppm (column 8, lines 26-31, column 9, lines 24-40, column 10, lines 34-37); the source of water to be treated is also disclosed (column 5, lines 41-61). removing ionic material in a first reverse osmosis stage up to 95 % is disclosed (column 6, lines 55-65), and removal of 90 % of the remaining ions in the second reverse osmosis membrane (column 9, lines 1-17) therefore, removal of silica as claimed should have been expected to the skilled in the art. Reference '053 fails to disclosed the process including all the conditions of the claimed process of making the product water, however, teaches the product water with properties., e.g TOC ans silica or ionized species level claimed, the degree of purity measured as resistivity greater than 1 also indicates the degree of purity of the produced water in the references above. Regarding claims 29 and 33 water free of virus and bacteria is produced, e.g. water meeting the USP standards (column 9, lines 24-39).

Claims 11-36 are rejected under 35 U.S.C. 103(a) as being unpatentable over Bhave et al. 2. (5.645.727). Reference '727 discloses the product "water" having the TOC, Silica, Boron, bacteria levels claimed (Tables II and III), virus removal is not disclosed, but since the process remove pyrogen and bacteria by reverse osmosis and other polishing steps, virus is also expected to be remove. Reference '727 fails to disclose the process steps for producing water, but discloses the water with the claimed purity. Since product by process claims are product, the rejection is proper.

Art Unit: 1723

3. Claims 11-15 are rejected under 35 U.S.C. 103(a) as being unpatentable over Abe et al. (5,573,662).

Reference '662 discloses product water with the level of TOC as in the product of the claims above (column 7, Table). The process including the claimed steps for producing the water are not disclosed, but treating the water by reverse osmosis unit, which remove alkalinity and hardness ions, vacuum deaeration to remove gases, ion exchange and ultraviolet as water refining steps.

Therefore, although he process including pH adjustment is not disclosed, producing water having the TOC level claimed is disclose.

4. Claim 16 is rejected under 35 U.S.C. 103(a) as being unpatentable over Tao et al. (5,250,185). Reference '185 discloses a product water containing 1.2 % of boron (column 7, lines 38-47). The process for producing the product water includes pretreatment, reverse osmosis, pH adjustment prior the reverse osmosis, sodium, calcium, silica sulfate carbonate and TOC are also remove by the process (table I. columns 7-8). It would have been obvious to ne skilled in the pertinent art to produce water with he same quality by treating the water at the same pH and by reverse osmosis as suggested by '185.

### Response to Amendment

5. **Response to Applicant's Remarks:** the claims rejected in paper No. 10 (final rejection) have not been further amended, a response to the final office action has been received with a request for a CPA, whihch is acknowledged. In response to the later response to filed on

Art Unit: 1723

10/09/01, the same final rejection has been amintained and made final becuae of the reasons discussed bellow.

With respect of arguments about Collentro 's references in section 1., claims 11-12 are only directed to a "low solute containing water", which limitation is meet by reference '479, which produces water with a resistivity of 10 megohm-cm. Regarding the TOC content of the water procut, this is also meet by the degree of purity of the water produced by '479; '479 discloses removing organic matter (causing TOC), by pretreatment with nanofiltration and activated carbon, the NF haiving pore size as low as 0.008 micron, and the total pretreatment produces a water to be treated in the first reverse osmois membrane having a total dissolved solids as low as 4.5 ppm, since total organic carbon is part of the total organic solid content in the water, it would have been obvious to one skille di nt he art at the time the invention was made to expect the final water produce from the l ast RO stage to have TOC levels than Applicant's claimed values. Reference '053 also teaches the bacteria and TOC levels claimed, where a total organic carbon of less than 500 ppb is disclosed (column 9, lines 24-39). Atotal deissolved solids in the range of 0-300 ppm in the product water is also dislcosed (column 10, lines 34-37), for aresistivity of 2-4 megohm. Therefore, the TOC level in water with higher degree of purity, e.g. 10 megohm, as in '479 should be less than 500 ppb, which is lower than the claimed values in present application. In response to argumets in 2., Product by process claims are products, The invention defined by a product-by-process claims IS a product, NOT a process. <u>In re</u>

Bridgeford, 357 F2d 679; 149 USPQ 55 (CCPA 1996). It is the patentability of the product

Art Unit: 1723

claimed and NOT of the recited process steps which must be stablished. <u>In re Brown</u>, 459 F2d 531; 173 USPQ 685(CCPA 1976). A comparison of the recited process steps with the prior art processes does NOT serve to result theissue concerning the patentability of the product. <u>In re</u> Fessman, 489 F2d 742; 180 USPQ 324 (CCPA 1974).

Applicant argues that Bhave et al does not teach the percentages with respect to the feed water; the claims in the pesent invention are directed to "product water with low solute", and only the final composition of the product water for TOC, Boron, silica, etc. are claimed, and not as function of the initial composition. As mention in the case law above, the process step, in this particular case does not define the product, and the product as shwon in the prior art can be made byother processes. Regarding arguments in 3., and 4, the same response to arguments in 2 apply.

6. Applicant's amendment necessitated the new ground(s) of rejection presented in this Office action. Accordingly, **THIS ACTION IS MADE FINAL**. See MPEP § 706.07(a). Applicant is reminded of the extension of time policy as set forth in 37 CFR 1.136(a).

A shortened statutory period for reply to this final action is set to expire THREE MONTHS from the mailing date of this action. In the event a first reply is filed within TWO MONTHS of the mailing date of this final action and the advisory action is not mailed until after the end of the THREE-MONTH shortened statutory period, then the shortened statutory period will expire on the date the advisory action is mailed, and any extension fee pursuant to 37 CFR 1.136(a) will be calculated from the mailing date of the advisory action. In no event,

Application/Control Number: 09/243,237 Page 7

Art Unit: 1723

however, will the statutory period for reply expire later than SIX MONTHS from the date of this final action.

7. Any inquiry concerning this communication or earlier communications from the examiner should be directed to Ana Fortuna whose telephone number is (703) 308-3857. The examiner can normally be reached on Monday-Friday from 9:30 to 6:00.

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, Wanda Walker, can be reached on (703) 308-0457. The fax phone number for the organization where this application or proceeding is assigned is (703) 872-9310 for regular responses, and (703)872-9311 for after finals.
